Global Semiconductor Value Chain Mapping Exercise

- Global Semiconductor Value Chain
- International Semiconductor Industry Key Market Actors
- Ireland's Semiconductor & Microelectronics Industry

Introduction

- Semiconductors are underpinning and ubiquitous electronic components across all modern technologies.

- The global market for semiconductors was $527 billion in 2023 and is projected over reach over $1 trillion by 2030.

- The growth of the global market for semiconductors is directly linked with the driving forces of population growth, urbanisation , and mobility.

- Key megatrends for market growth include AI, Industrial technologies, mobility, space and defence and consumer electronics.

Global semiconductor market value by vertical, indicative, $ billion

Semiconductor Industry from 2015 to 2025 | SEMI

Introduction

- Semiconductor chips are pieces of silicon or other semiconducting material with miniature circuits that perform specific electronic tasks.

- Chips have four main categories of functionality: Logic Chips, application-specific integrated chips (ASICs) and system-on-a-chip devices (SoCs).

  - Logic chips process information such Central Processing Units (CPUs), graphics processing units (GPUs) optimized for visual display, neural processing units (NPUs) designed for deep and machine learning applications, Tensor Processing Units (TPUs) designed to accelerate machine learning workloads.

  - Memory chips store information. There are two types of memory: volatile and non-volatile. Examples are Dynamic Random Access Memory (DRAM) and NAND Flash.

  - ASICs are simple, single-purpose chips used for performing repetitive processing routines.

  - SoCs are essentially integrator chips. They are a relatively new type of chip that combines many chips and circuits in a single chip and may integrate things such as graphics, audio, camera, video and Wi-Fi.

Semiconductor Industry from 2015 to 2025 | SEMI

Semiconductor Market Dynamics

- The semiconductor value chain is highly complex, characterised by globally distributed production processes and interlinked stages.

- In recent decades economies of scale, logistics and materials costs an increasing factor which has shaped the location of research, design, manufacturing and test functions.

- Across the thousands of key market actors, the industry remains highly polarized with small sets of industry players commanding market dominance and therefore market vulnerability is inherent.

- Semiconductor value chain susceptible to vulnerability and bottlenecks should unexpected events shock or impact the efficient functioning of global trade and logistics.

- There is a growing need for establishing granular level value chain mapping to assess the functioning of the industry and to ensure mitigating policies are in place to alleviate potential disruption.
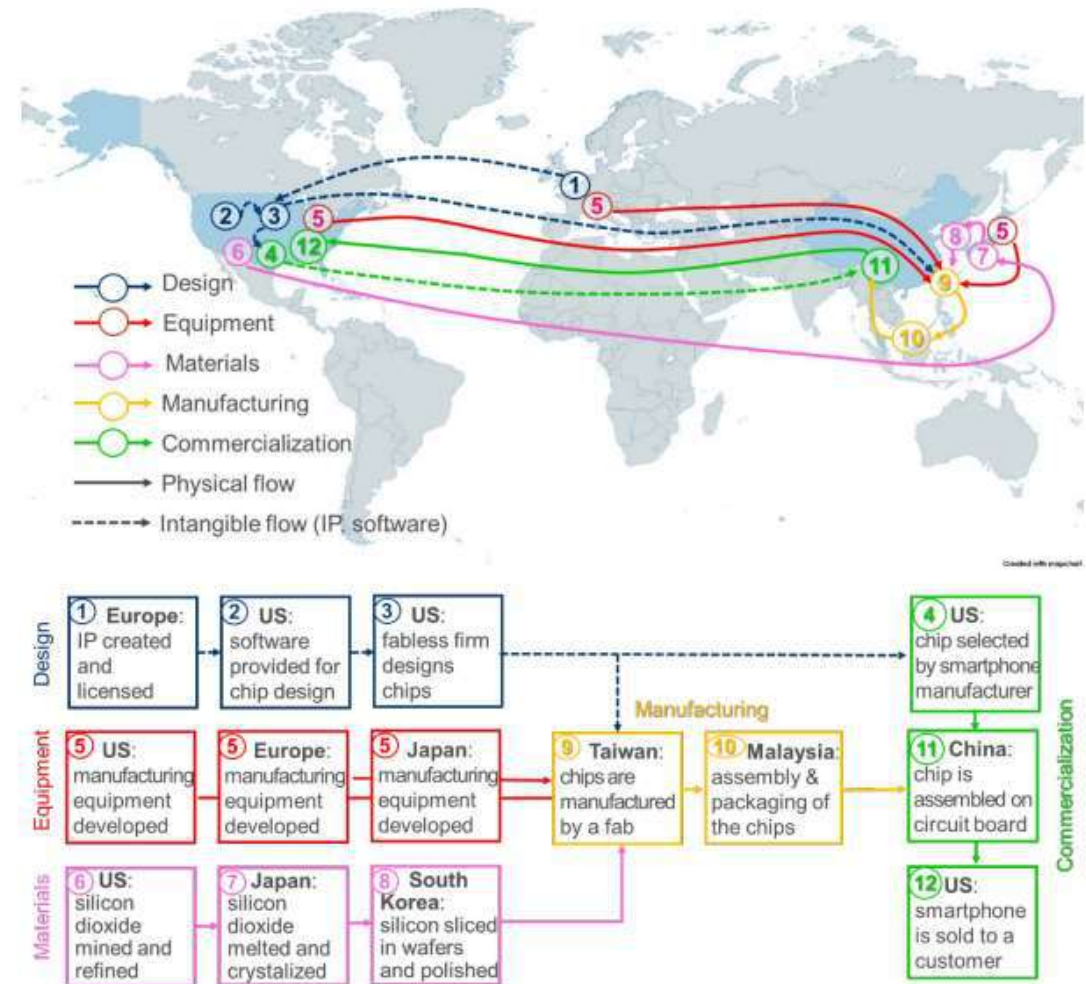

Source: JRC rearrangement from BCG (2021).

Mapping of Ireland's Semiconductor & Microelectronics Industry – Department of Enterprise, Tourism and Employment

Semiconductor Market Dynamics
European Perspective

- European market $53.809 billion in 2022, a 12.3% increase on 2021, 8.6% of the global market.

- Leading role in research through entities such as IMEC, Leti and Fraunhofer, and equipment manufacturers such as ASML, Zeiss, and Trumpf.

- Key drivers: automotive (37%), industrial consumption (25%).

- High dependency on US and Asian inputs and

- In the EU value chain, nearly 80% of input suppliers and 63% of customers to the companies in the chain are outside of the EU.

No. Companies in the Semiconductor Supply Chain by MS
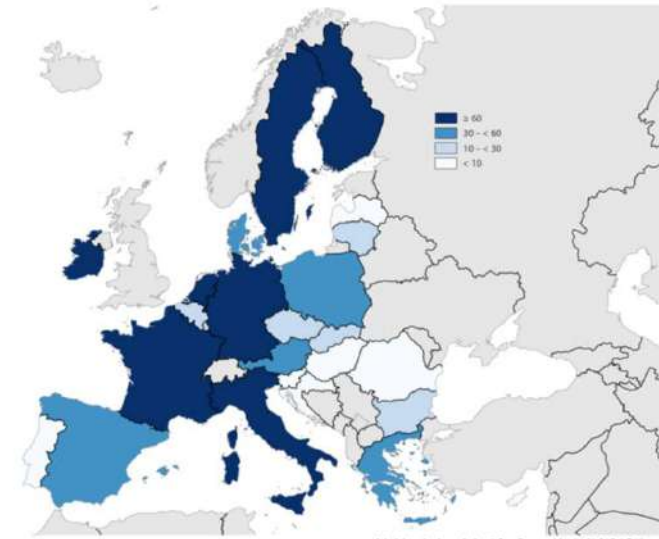

Sales based on company headquarters location, % share
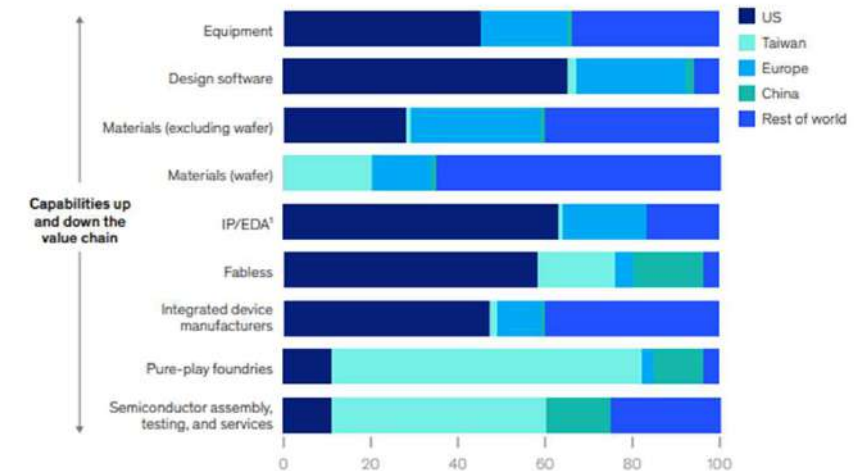

Global Semiconductor Industry: Dynamics

- Recent years has seen policy level developments across global jurisdictions to mitigate against supply chain disruptions and strengthen economic security.

- Chips Act Packages have been developed to support technology trends and to mitigate against vulnerabilities of the semiconductor supply chain: US Chips & Science Act (Aug. 2022), EU Chips Act (Sept. 23), Japan (Nov. 23), India (Feb 24), South Korea (March 24), China (May 24).

- Industrial investment in semiconductor manufacturing has been forecast to be approximately $2.3 Trillion in capex between 2024-2032. https://www.semiconductors.org/america-projected-to-triple-semiconductor-manufacturing-capacity-by-2032-the-largest-rate-of-growth-in-the-world/

- Innovation activity continues to surge on the back of global investments. Key organisations in this sector are based in Europe (e.g. IMEC (BE), CEA-Leti (FR), Fraunhofer (DE), and the US (e.g. SEMETECH, Albany, Semiconductor Research Corporation).

- Key themes which drive innovation: continued miniaturisation (advanced leading edge <5nm), alternative materials (Ge, GaN, SiC, InP, GaAs, Graphene), energy consumption.

- Joint ventures and industrial partnerships have emerged as a growing trend. Investments by TSMC in Europe to form a new JV named ESMC involving Bosch, Infineon, NXP.
Global Semiconductor Industry: Structure

- There are three main phases associated with the production of semiconductor chips:
  - Design
  - Manufacture
  - Assembly, testing and packaging (ATP)

- These phases are preceded by a number of preliminary activities such as pre-competitive and competitive research, development of specific IP and design tools.

- Both manufacturing and ATP phases are underpinned by materials and equipment.

- There are two conventional business models for semiconductor manufacturing, fabless-foundry and Integrated Device Manufacturing (IDM).
Global Semiconductor Industry: Structure

- Based on the semiconductor supply chain structure published by European Commission JRC, 2023, and cross-referenced to the OECD- Directorate for Science, Technology and Innovation, Digital Policy Committee publication: Mapping the semiconductor value chain, 2024, the following sub-sets are proposed to build a detailed mapping of key market actors.

Subsets:
- **Design Tools, Electronic Design Automation, and IP Cores companies**
- **Manufacturing and Test Equipment companies**
- **Materials and Chemical supplier companies**
- **Fabless Design companies**
- **Foundry companies**
- **Assembly, Testing and Packaging companies**
- **Integrated Device Manufacturers**
- **Research and Development institutions and commercial entities**

https://publications.jrc.ec.europa.eu/repository/handle/JRC133850

Global Semiconductor Industry: Structure

Subset Definitions:

- **Design Tools, Electronic Design Automation, and IP Cores**

  EDA companies are trusted intermediaries between design companies and foundries providing design tools, reference flows and some services. Third party IP providers design and license IP building blocks (processors, libraries, memories, interfaces, sensors, and security).

- **Manufacturing and Test Equipment companies**

  Specialized companies that design, produce, and sell machinery and tools essential for semiconductor production.

- **Materials and Chemical suppliers**

  Raw and manufactured materials, such as silicon wafers, photomasks, and photoresists, along with certain chemicals, are necessary inputs across the semiconductor manufacturing process.

- **Fabless Design companies**

  Fabless semiconductor companies designs and sell semiconductors but do not own or operate its own fabrication facilities. These companies focus on the research, design, and development of semiconductor products, such as integrated circuits (ICs), and then outsource the manufacturing process to third-party foundries.

- **Foundry companies**

  Foundries manufacture chips for design firms. Instead of designing their own semiconductors, these design firms hand over their designs to foundries, which then turn these designs into physical chips.

- **Outsourced Assembly, Testing and Packaging companies**

  Outsourced semiconductor assembly and test (OSAT) vendors are the companies that offer integrated circuit (IC) packaging and test services, including wafer level services after fabrication.

- **Integrated Device Manufacturers**

  IDMs conventionally operate a vertically integrated business model where they design and conduct front and back-end manufacturing internally.

https://publications.jrc.ec.europa.eu/repository/handle/JRC133850

Global Semiconductor Value Chain Structure
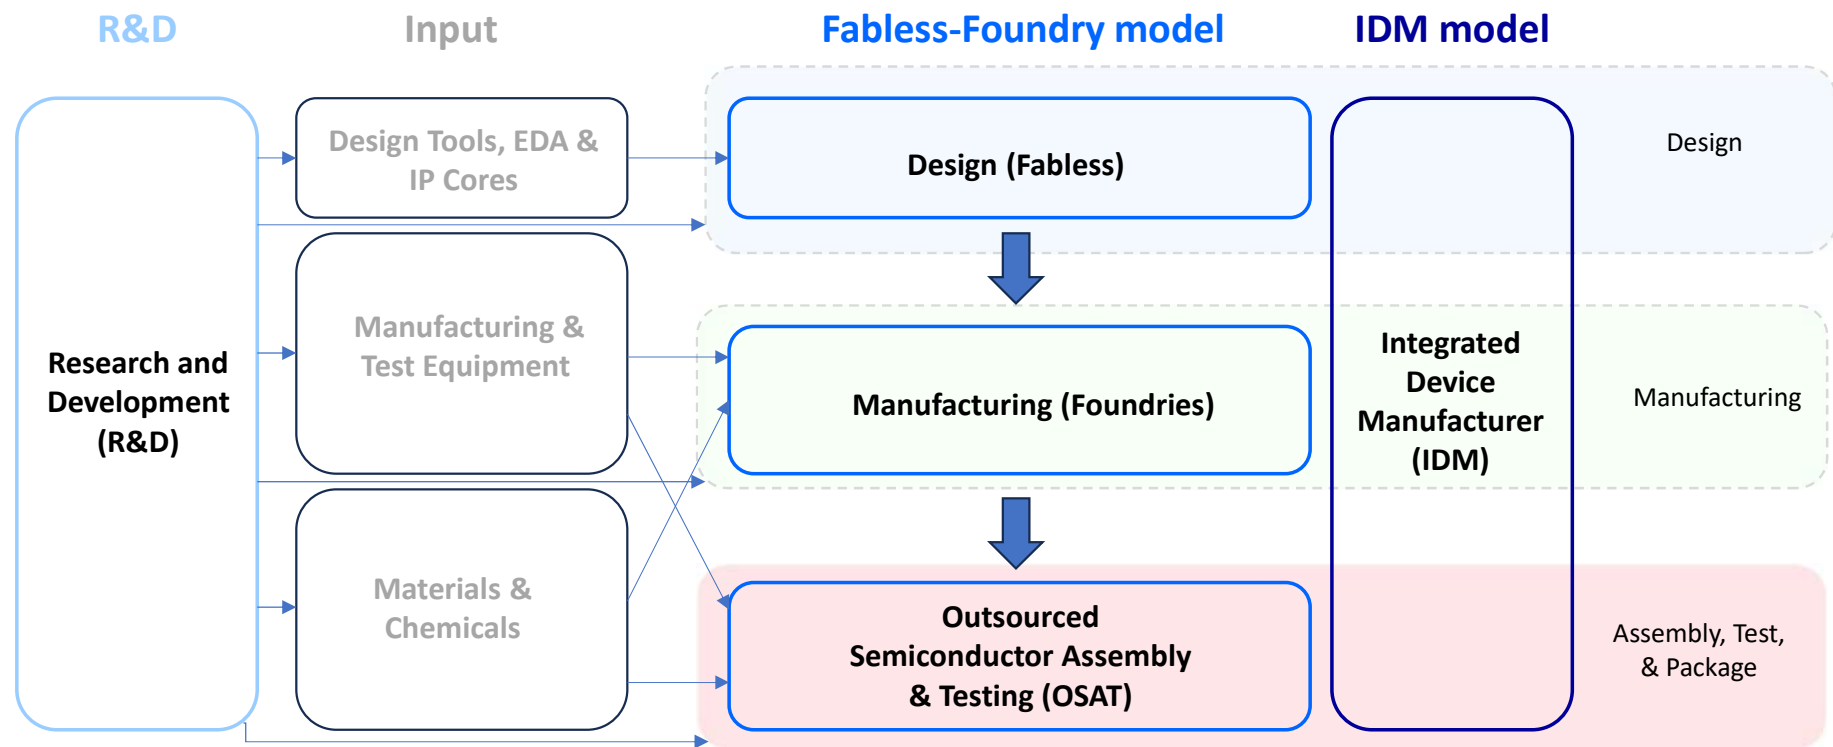

Global Semiconductor Value Chain Mapping Exercise

Semiconductor Value Chain Mapping

- The semiconductor value chain is highly complex and distributed across multiple global jurisdictions. To gain a deeper understanding of which countries host key market players and to understand the distribution of industry sub-sector activity a mapping exercise according to head-quartered entities has been undertaken.

- While this methodology may initially indicates the origin of management control over the industry it will not indicate the commercial proportion associated with these key market actors in terms of revenue. Additional studies which may identify revenue associated with companies as well as networks of subsidiaries may give additional insights into the proportionality of company activity as well as the describing the highly complex geographical spread of subsidiary companies involved in the semiconductor value chain.

- duplicates in this mapping exercise is deliberate at this point which is indicative of multiple companies being integral players across multiple industry subsets.

International Mapping

- This mapping exercise identifies key international companies head-quarter location as a function of industry sub-set.

National Mapping

- Identification of key market actors which have a presence in Ireland across industry sub-sets.

- Mapping of industry sub-sectors which enable the functioning of the industry. This includes suppliers of process control technology, energy and infrastructure management services.

- Mapping of ancillary sub-sectors encompassing construction, engineering and facilities services.

Semiconductor Value Chain Mapping

Key results:

International Mapping

International semiconductor industry key market actors ca. 745

- Design Tools, Electronic Design Automation, IP Cores: 181
- Semiconductor manufacturing equipment   178
- Chemical and materials: 123
- Fabless design companies: 94
- Foundry companies: 46
- Assembly, Test and Packaging companies: 32
- Integrated Device Manufacturers: 90
- Research and Development: 90

National Mapping: Ireland

Semiconductor industry: 41 companies (excluding chemicals)(multiple sites)(excluding R&D)

- Design Tools, Electronic Design Automation, IP Cores: 5
- Semiconductor manufacturing equipment   17
- Fabless design companies: 9
- Integrated Device Manufacturers: 10
- Research and Development: 4

Microelectronics Industry: ca. 40 companies

Manufacturing process equipment and services, electrification ad automation: ca. 16 companies

Engineering + Construction Services, materials, FM, PM: ca. 175 companies

Global Semiconductor Value Chain
International Industry Structure
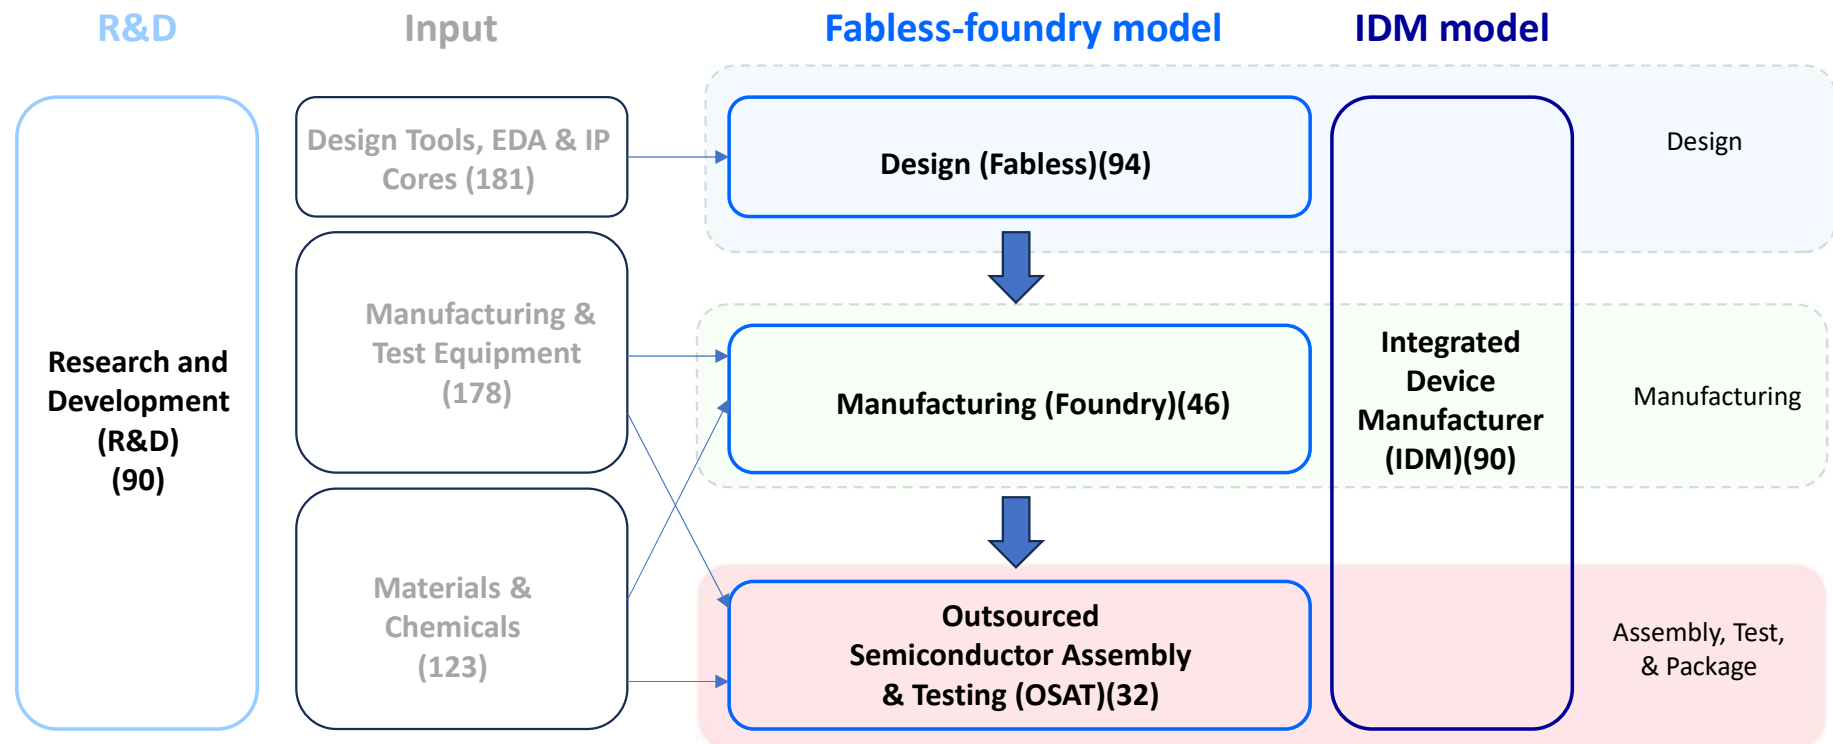

R&D | **Input** | **Fabless-foundry model** | **IDM model**

Research and Development (R&D) (90)

Design

Manufacturing

Assembly, Test, & Package

Key market actors: ca. 745

Global Semiconductor Value Chain

Mapping exercise data yields an approximate total of 745 companies which are key market actors across the semiconductor industry. This may be further broken down to indicate the relative proportion across global jurisdictions: Americas, Europe and Asia-Pacific

Global Semiconductor Industry

Total Companies (746)	239	137	370

0   100   200   300   400   500   600   700   800

■ Americas (32.7%)   ■ Europe (18.2%)   ■ Asia Pacific (49.1%)
Global Semiconductor Value Chain

Mapping exercise data indicates the proportion of sub-sector distribution across global jurisdictions; Americas, Europe and Asia-Pacific.

Caveat. The number of head-quartered companies is indicated across global regions however mapping the proportion of revenue within the key market actors would indicate a more accurate relative market share and indicate market dominances.
Semiconductor Industry
Sub-sector proportion across global regions

Market Share

International Semiconductor Industry Key Market Actors

Global Semiconductor Value Chain

Integrated Device Manufacturers (IDMs)

IDMs conventionally operate a vertically integrated business model where they design and conduct front and back-end manufacturing internally.

Many IDMs have begun to shift towards a fab-lite business model, where as opposed to conducting all of the manufacturing steps in-house some elements of both front-end and back end manufacturing may be outsourced to foundries and OSATs (outsourced assembly and test facilities).

IDMs have also begin to change their model in the regard on now offering foundry services themselves and opening up their production capacity to offer contract manufacturing to external customers for both front-end and back-end manufacturing.

The top ten IDMs by revenue 2024:

Samsung, Intel, SK Hynix, Micron, Infineon, TI, STMicroelectronics, NXP, Sony, Murata.

CXMT	Japan Semiconductor Corporation	NXP Semiconductors	Sharp Corporation	Texas Instruments Incorporated	YMTC
Denso	Macom	onsemi	SK hynix Inc.	Toshiba	Windbond Electronics Corp.

Global Semiconductor Value Chain

Foundry companies

Foundries manufacture chips for design firms. Instead of designing their own semiconductors, these design firms hand over their designs to foundries, which then turn these designs into physical chips. Essentially, foundries serve as the "factories" of the semiconductor world. Foundries collaborate closely with IP vendors and Electronic Design Automation (EDA) suppliers to offer a compete value chain to their customers.

The leading semiconductor foundry companies are key players in the global semiconductor manufacturing industry. These foundries specialize in producing integrated circuits (ICs) based on designs provided by fabless semiconductor companies. Some of the most prominent semiconductor foundry companies are:

1. **Taiwan Semiconductor Manufacturing Company (TSMC)** (Hsinchu, Taiwan) TSMC is the world's largest and most advanced semiconductor foundry, holding a dominant market share. It manufactures chips for major companies like Apple, AMD, Nvidia, and Qualcomm. TSMC is known for its cutting-edge technology, including 5nm and 3nm process nodes.

2. **Samsung Foundry** (Suwon, South Korea) Samsung Foundry is a close competitor to TSMC and is one of the leading players in semiconductor fabrication. Samsung produces chips for companies like Qualcomm, Nvidia, and its own internal products (e.g., Exynos processors).

3. **GlobalFoundries** (Santa Clara, California, USA) GlobalFoundries is a key player in the semiconductor foundry market, focusing on mature process nodes (e.g., 14nm, 12nm) and providing services for a wide range of industries, including automotive, IoT, and communications.

4. **United Microelectronics Corporation (UMC)** (Hsinchu, Taiwan) UMC is one of the major semiconductor foundries, competing mainly in the mid-range process nodes (e.g., 28nm, 40nm). It serves a wide range of industries, including automotive, consumer electronics, and communications.

5. **SMIC (Semiconductor Manufacturing International Corporation)** (Shanghai, China) SMIC is China's largest semiconductor foundry, with a growing presence in the global market. While it lags behind TSMC and Samsung in terms of advanced process technologies, it has made significant strides in producing chips for applications like smartphones, IoT, and automotive systems.

These companies are critical to the production of semiconductors for a wide array of industries, from consumer electronics to automotive to industrial applications. TSMC and Samsung, in particular, lead the charge in terms of technological advancements and market share.

Global Semiconductor Value Chain

Manufacturing and Test Equipment

Specialized companies that design, produce, and sell machinery and tools essential for semiconductor production. This equipment is crucial for the fabrication and testing of semiconductor devices, such as transistors, capacitors, and integrated circuits.

Semiconductor manufacturing equipment (SME) that facilitates the precision, scale, speed, purity, and dependability required to sustainably produce semiconductors is expensive and extremely difficult to make. As such, its supply is highly concentrated in key companies and regions. SME includes wafer fabrication on the front end as well as semiconductor assembly, test, and packaging equipment for back-end fabrication.

Subsets
- Wafer fabrication equipment
- Microlithography and masking equipment
- Etching and cleaning tools
- Deposition tools
- Photolithography scanner equipment (EUV and non-EUV)

- Gas and liquid handling equipment
- Process monitoring and control equipment
- Inspection and metrology equipment
- Characterization equipment
- Chip test equipment
- Assembly/packaging equipment

Global Semiconductor Value Chain

Materials and Chemicals

Raw and manufactured materials, such as silicon wafers, photomasks, and photoresists, along with certain chemicals, are necessary inputs across the semiconductor manufacturing process.

The market for fabrication materials exceeded $40 billion in 2021 and is concentrated in the United States, Germany, Japan, Taiwan, South Korea, and China.

In 2021, Taiwan captured the largest slice of the market, with a quarter of global materials market share by sales. On the other end of the spectrum, Europe (9 percent) and China (15 percent) enjoy the smallest shares of the market. Although small by measure of total sales volume, Europe occupies a critical space in the materials supply chain, particularly in the supply of chemicals.

China holds a much stronger position in the supply of raw materials, particularly in low-grade gallium, tungsten, and magnesium, than in manufactured materials.

Subsets
- Photoresist
- Bulk crystal source materials
- Wafer substrates
- Photomasks
- Photoresist ancillaries
- Electronic gases
- Wet chemicals

- Sputtering targets
- CMP (Slurries and Pads)
- Other wafer fab materials
- Deposition materials
- Assembly and packaging materials
- Facility consumables

Outsourced Assembly, Test, and Packaging (OSAT)

Outsourced semiconductor assembly and test (OSAT) vendors are the companies that offer integrated circuit (IC) packaging and test services, including wafer level services after fabrication and prior to separation of die, the separation of die and subsequent packaging and testing of separated die.

OSATs provide package design support to fabless and non-fabless companies, packaging to silicon devices that are made by foundries, and test services prior to shipping to the customer.

OSATs mainly focus on offering innovative packaging and test solutions for semiconductor companies in well-established markets such as communications, consumer & computing, automotive, aerospace, defence, and space in addition to emerging markets in industrial, medical, the Internet of Things (IoT), artificial intelligence (AI), and wearable devices. OSATs offer cost-effective and innovative packaging solutions that enable higher performance, processing speeds and functionality of ICs with a reduction in space in an electronic device.

OSAT companies come into major play at the end stage of the semiconductor manufacturing process after the wafer fabrication and wafer probe stages. OSATs offer packaging and assembly solutions that involve the processing of bare semiconductors into finished semiconductors, which helps in protecting the die as well as facilitating electrical connections and heat dissipation. After packaging the customer's die, OSATs conduct final testing to ensure that the packaged semiconductor meets performance specifications. OSATs offer a wide range of semiconductor test services that includes various types of final, system-level, wafer, and strip testing along with the complete end of line services up to and including final shipping.

Key players in the OSAT market:

- ASE Technology Holding Group
- Amkor Technology Inc.
- Powertech Technology Inc.
- Chipmos Technologies Inc.
- King Yuan Electronics Co. Ltd
- Jiangsu Changjiang Electronics Technology Co. Ltd
- UTAC Holdings Ltd
- Tongfu Microelectronics Co.
- Chipbond Technology Corporation
- Hana Micron Inc.
- Tianshui Huatian Technology Co. Ltd

Global Semiconductor Value Chain

Fabless Companies

Fabless semiconductor companies designs and sell semiconductors but do not own or operate its own fabrication facilities. These companies focus on the research, design, and development of semiconductor products, such as integrated circuits (ICs), and then outsource the manufacturing process to third-party foundries, such as TSMC (Taiwan Semiconductor Manufacturing Company) or GlobalFoundries.

The business model of a fabless semiconductor company involves:

Designing Semiconductor Products: The company invests in research and development (R&D) to create innovative chips or circuits for various applications, like processors, memory, or communication devices.

Outsourcing Manufacturing: Rather than building and maintaining expensive fabrication plants, fabless companies contract out the manufacturing of their designs to foundries, which specialize in high-volume semiconductor production.

Focusing on Innovation and Marketing: By outsourcing manufacturing, fabless companies can focus more on innovation, product differentiation, and go-to-market strategies rather than capital-intensive manufacturing and operational complexities.

Supply Chain and Partnerships: These companies often develop close relationships with foundries, equipment providers, and other partners to ensure efficient production and timely delivery of their products. This business model allows companies to avoid the significant capital costs associated with running a semiconductor fab, while still benefiting from the growing demand for semiconductor technology. Prominent examples of fabless semiconductor companies include Qualcomm, Nvidia, AMD, and Broadcom.

Key Fabless companies:

- Nvidia
- Qualcomm
- Broadcom
- Advanced Micro Devices (AMD)
- MediaTek
- Marvell Technology
- Novotek Microelectronics
- Realtek Semiconductor
- Will Semiconductor
- Monolithic Power Systems (MPS)
- Cirrus Logic

EDA Design Tools and IP Cores

EDA (Electronic Design Automation) design tools and **IP (Intellectual Property) cores** are crucial components that support the development and manufacturing of semiconductors, particularly integrated circuits (ICs).

1. **EDA Design Tools**: These are specialized software tools that aid engineers and designers in creating, simulating, testing, and verifying the design of integrated circuits. EDA tools are used throughout the entire semiconductor design process, including:

   - **Schematic capture**: Creating diagrams of the circuit's layout.

   - **Simulation**: Testing the circuit design under various conditions to predict performance.

   - **Layout design**: Placing the circuit's components on the silicon chip and routing the connections.

   - **Verification**: Ensuring that the design functions as intended and meets all specifications.

   EDA tools help reduce design errors, shorten time-to-market, and improve the overall efficiency of semiconductor development. Key players in this market include companies like **Cadence Design Systems, Synopsys**, and **Siemens EDA**.

2. **IP Cores**: These are pre-designed, reusable blocks of logic or functionality that can be integrated into a custom chip design. IP cores can range from basic elements like adders and multipliers to more complex components like processors, memory controllers, and communication interfaces. Using IP cores allows semiconductor designers to avoid reinventing the wheel for common functions and focus on differentiating aspects of their designs, saving time and reducing risk. Some IP cores are available for licensing, while others are open-source or developed in-house.

Examples of IP core providers include companies like ARM, which provides processor cores, and Imagination Technologies, which offers GPU IP cores.

Mapping of Ireland's Semiconductor & Microelectronics Industry – Department of Enterprise, Tourism and Employment

Ireland's Semiconductor & Microelectronics Industry

Ireland's Semiconductor & Microelectronics Industry

- Ireland has had an established base of over 80 companies which employ 27,000+ people in the semiconductor and microelectronics sector.

- Ireland hosts 15 of the world's largest 30 semiconductor companies across EDA & IP, design, and manufacturing operations. Examples are Analog Devices, Intel, AMD, Infineon, Qualcomm.

- Ireland is also home to a growing number of equipment and materials vendors servicing the domestic semiconductor manufacturing sector as well as wider markets across the EU. Examples are TEL, Lam Research, KLA, ASML, Applied Materials.

- Ireland has seen a stream of high-profile investments into the industry through acquisition, through expansion of existing operations as well as new market entrants who are establishing European operations from Ireland.

- Ireland is also home to a stream of high potential start-up companies in photonic packaging, heterogenous integration, quantum hardware technology, as well as on-chip cooling solutions and advanced materials for manufacturing.

- Ireland also has a vibrant innovation ecosystem which supports the semiconductor industry. Tyndall National Institute is a flagship facility which actively collaborates with industry, a range of European collaborative research programmes and has direct collaborative links with top-tier organisations such as IMEC, Leti and Fraunhofer.

Mapping of Ireland's Semiconductor & Microelectronics Industry – Department of Enterprise, Tourism and Employment
Ireland's Semiconductor & Microelectronics Industry

Key industry statistics:
Companies: 80+
Employment: 27,000+
Exports: €15.5 Bn
Payroll: €2 Bn
In-house R&D: €5.6 Bn
Capital Expenditure €11 Bn
Expenditure into Irish Economy: €3.3 Bn
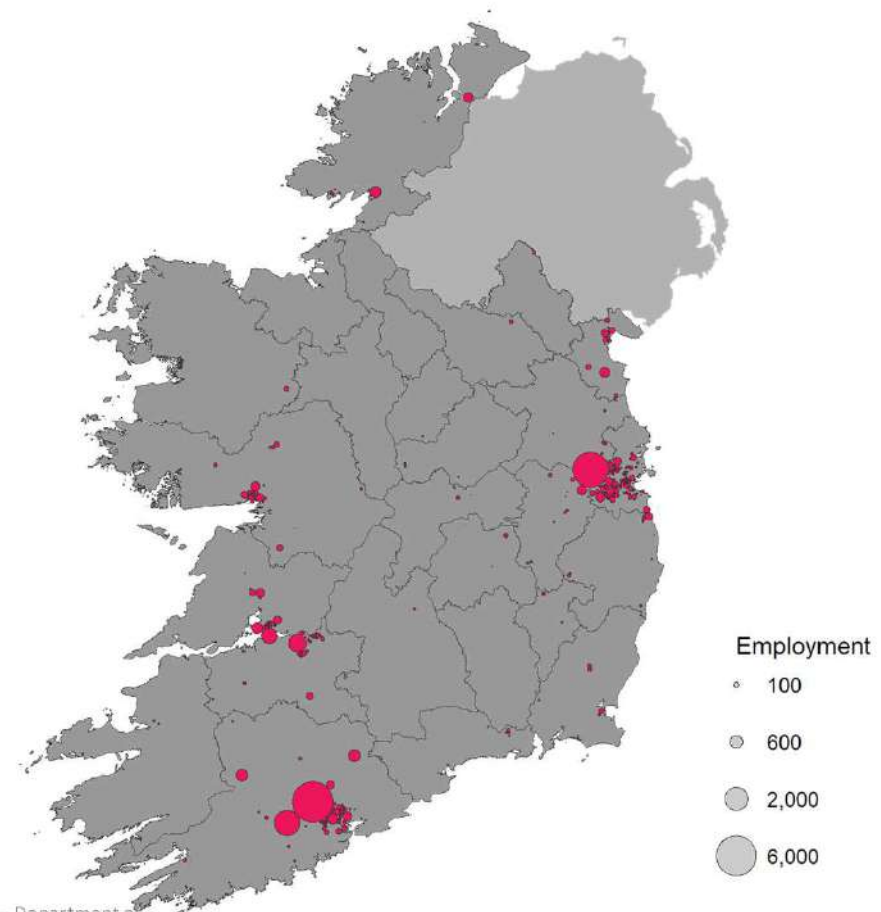

Employment

Ireland's Semiconductor & Microelectronics Industry

Integrated Device Manufacturers:
- Analog Devices
- Bosch
- Infineon
- Intel
- MACOM
- Microchip
- Onsemi
- Qorvo
- Skyworks
- Vishay

Fabless:
- A-DAPT
- AMD
- Apple
- Broadcom
- Equal 1
- IBM
- Parade
- Qualcomm
- uBlox

Design Tools, EDA & IP Cores:
- Arm
- Autodesk
- Cadence
- Siemens
- Synopsys

Manufacturing & Test Equipment:
- Applied Materials
- ASML
- ASM
- Daifuku
- Ebara
- Edwards Vacuum
- KLA Corporation
- Kokusai Electric
- LAM Research
- Lasertec
- Materion
- Nikon
- Onto
- PSK
- SCREEN
- Tokyo Electron
- Trumpf

Materials & Chemicals:
- Air Products
- Boc
- Brenntag
- Schlötter
- Chemco
- Merck Group
